

Webtable 3a

Modification of the hazard ratio (HR) of ACEI/ARB use for death by potential confounding variables. Those variables that changed the HR of ACEI/ARB use by more than 10% if omitted from a bivariable model involving ACEI/ARB use and the potential confounder were included in a 'multivariable model adjusted for variables identified as confounders' (see table 2 bottom).

Variable	Modification of HR of ACEI/ARB (%)
Heart disease	31·5%
Vascular disease	31·2%
Cholesterol	-28·4%
Number of antihypertensive drugs	20·6%
Hemoglobin	-20·4%
Oral antidiabetic medication or insulin	9·4%
Diabetes status	8·4%
Year of first renal replacement therapy	4·7%
Recipient age at first transplantation	4·7%
Body weight	2·1%
Cumulative time on dialysis	-1·5%
Cumulative transplant number	0·4%
