

Webfigure 8

Patient survival (CCO analysis)

Scaled residuals(Bt) versus time.
P-value for linear association of Residuals with Patient survival time (years): 0.0042

The adjusted hazard ratio of AZA during the first 6 months is >1 , and reverted afterwards. After about 4 years, there is no difference between AZA and MMF.

This was also revealed by doing a separate analysis with follow-up > 1 year (see forest plot).
