

Supplementary table S4

Potential effects of drug combinations suggested by the MMF synlet graph with or without addition of MMF. This table summarizes a number of potential interactions pointed out in the manuscript although searching for MMF independent interactions and effects of alleles was not focus of the study.

Indication	Drug combination	Proposed Effect
Antineoplastic activity	Alendronate / MMF	Antagonism
Osteoporosis, Paget's disease, Cushing's disease	Bisphosphonate drugs and Metyrapone or Mitotane with or without MMF	Synergism
Surgery / hypertension in Cushing's syndrome	Bisphosphonate drugs and Flurane anesthetics with or without MMF	Synergism ?
Studies involving MMF	SDHA inhibitors or natural variants such as SNPs	Synergism/Antagonism?; Side-effects; Clinically beneficial effect on natural SDHA variants and associated diseases such as cardiomyopathy and paraganglioma.
